Introduction

Falls

Common

1/4 of people over 65 fall at least once a year

(Alexander, Rivara, & Wolf, 1992)

Costly

Cost of fall related care 30,000,000,000 \$

(Burns, Stevens, & Lee, 2016)

Harmful

1 in 5 falls in older adults results in major injuries

(Sterling, O'Connor, & Bonadies, 2001)

Each year at least 300,000 older people hip fractures

(Boslaugh, 2016)

Visual assessments

Subjective
Patients tend to outperform or underperform
Just a glimpse of what happens in real life

Laboratory assessments

Expensive
Complex
Time consuming
Not available for everyone
Not real life

Why measure gait?

How to measure?

What to measure?

Étienne-Jules Marey 1883

Accelerometers discovered 1975

Size reduced
Cost reduced

Now

Acceleration
Angular velocity
Magnetic field

Use IMU found in everyday embedded devices to assess gait

Inertial measurement units

Fall detection

Review

Smartphone-Based Solutions for Fall Detection and Prevention: Challenges and Open Issues

Mohammad Ashfaq Habit^{1,2,3}, Mas S. Mohktar^{1,2}, Shahrul Bahyah Kamaruzzaman^{2,4}, Kheng Seang Lim^{2,4}, Tan Maw Pin^{2,4} and Fatimah Ibrahim^{1,2,4}

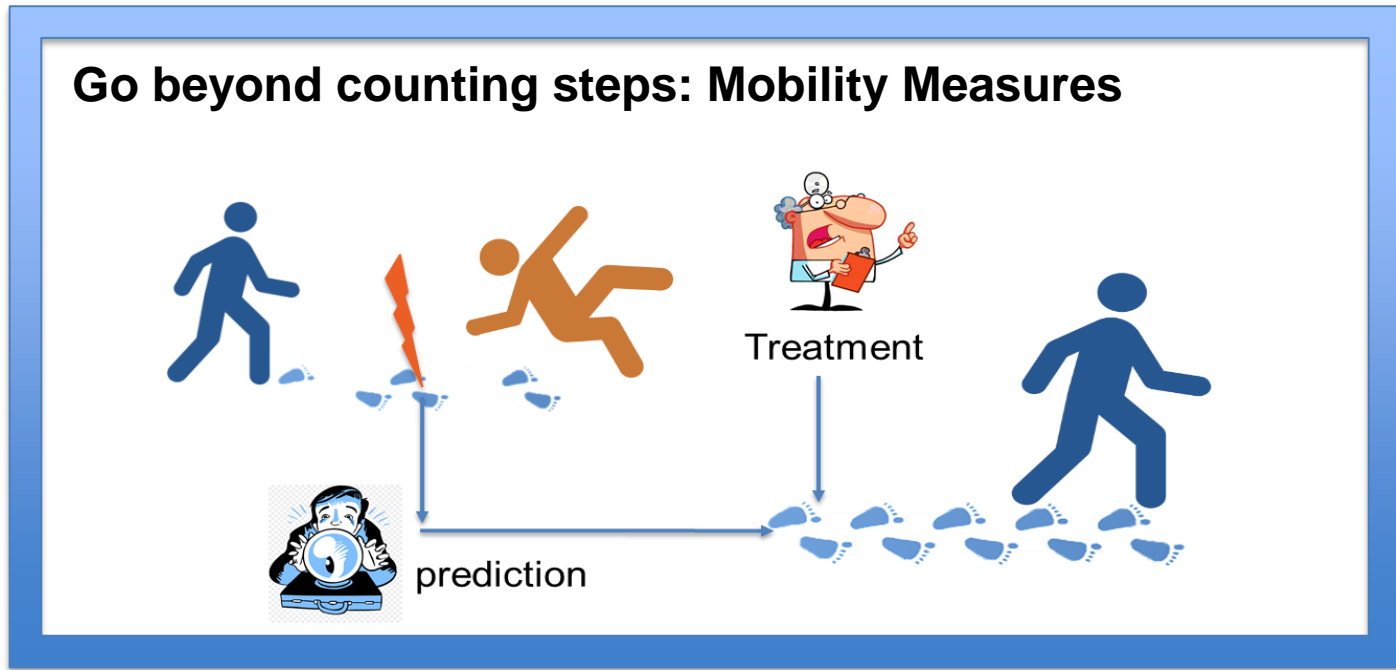

Article

Analysis of Android Device-Based Solutions for Fall Detection

Eduardo Casilari^{*}, Rafael Luque and María-José Morón

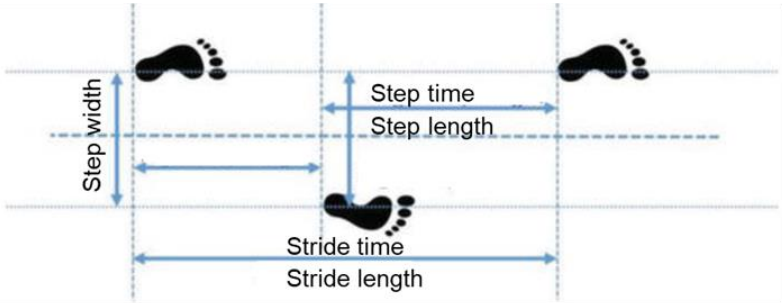

Departamento de Tecnología Electrónica, ETSI Telecomunicación, Universidad de Málaga, 29071 Málaga, Spain. E-Mails: rluque@uma.es (R.L.); mijmoron@uma.es (M.-J.M.)

In 2017, **59%** of adults **65–69** years old, **49%** of adults **70–74** years old, and **31%** of adults **75–79** years old are smartphone owners

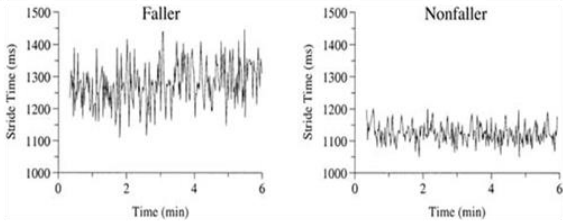

• Gait Variability: Stride time variability

Neuromotor noise is increased, which in its turn results in a greater variability

Gait variability: methods, modeling and meaning
Jeffrey M Hausdorff*^{1,2,3}

Gait Variability and Fall Risk in Community-Living Older Adults: A 1-Year Prospective Study
Jeffrey M. Hausdorff, PhD, Dean A. Rios, BS, Helen K. Edelberg, MD

Gait Variability Is Associated With Frailty in Community-dwelling Older Adults
Manuel Montero-Odasso,^{1,2,3} Susan W. Muir,¹ Maggie Hall,⁴ Timothy J. Doherty,^{2,5} Marita Klooseck,⁶ Olivier Beauchet,⁷ and Mark Speechley³

• Non-linear measures: Lyapunov Exponent.

Reflects the ability to recover from small perturbation

Local dynamic stability and variability of gait are associated with fall history in elderly subjects

Marcel J.P. Toebees^a, Marco J.M. Hoozemans^a, Regula Furrer^a, Joost Dekker^b, Jaap H. van Dieën^{a,*}

Smartphone sensor Quality?

L. Pepa et al.

Heel Strike detection error of around 7 ms

Pepa et al. 2017

Manor et al. 2018

Stride times derived from the smartphone app and a reference device were highly correlated with an error of around 17ms

Sensor Quality is not the issue

Find a method to process the data and be robust against real life activities

What is real life?

Holding your smartphone the way you like to hold it, doing whatever you like, wherever you like.

It is complex!

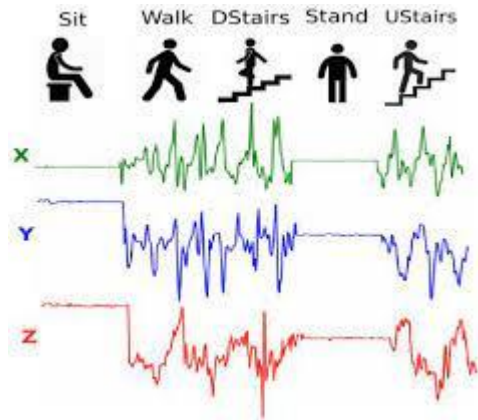

Different user behavior

shutterstock.com - 1458077786

Different walking environments

Different activities

Controlled environment test

Objective

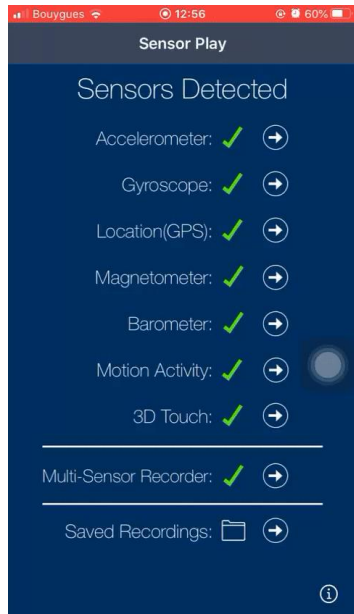

Find a robust way to process the **smartphone Accelerometer and Gyroscope signal** for frequent phone positions to **detect steps** and **calculate stride time variability**

Iphone 6s

Found on the Appstore

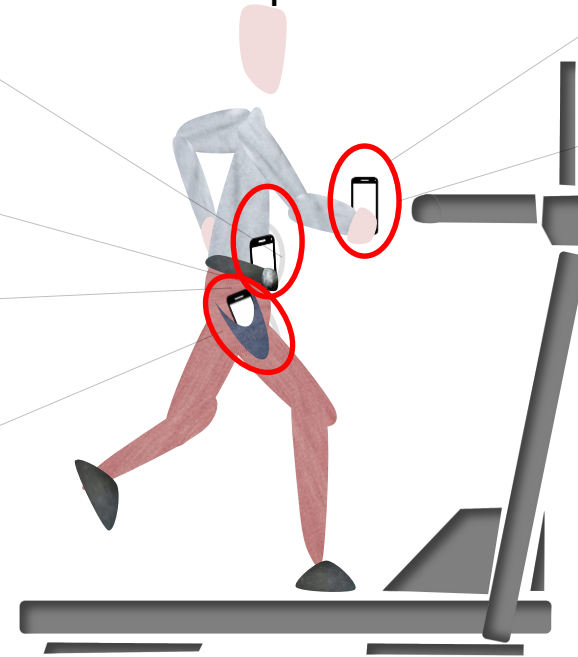

Sampling frequency: 100Hz

10 participants average Age~28 years

Detect peaks.

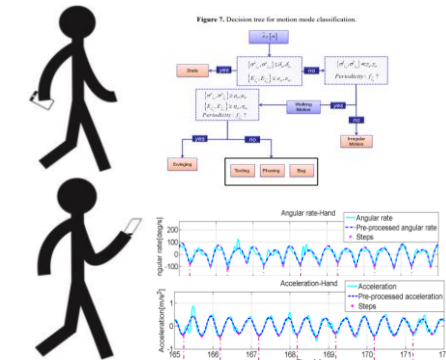

3 speeds: Comfortable- Low- High and asymmetrical mode

Preliminary Findings

Susi et al. 2013

Hand is a more complex: **Motion mode** of the hand affects the signal
Strength of swing affects the signal

To treat mis-detected steps we apply statistical filtering

Remove abnormal strides more than 1,5sec and less than 0,8sec
Remove strides more than 3 SD away from the mean

Findings

(a) Hand

(b) Pocket

(c) Waist

%filtered	Treadmill operational mode			
	Low	Comfortable	High	Asymmetrical
Waist	1 ± 1	2 ± 4	1 ± 1	1 ± 0.
Pocket	1 ± 0.	2 ± 2	1 ± 2	0. ± 0.
Hand	25 ± 14	14 ± 8	10 ± 6	31 ± 16

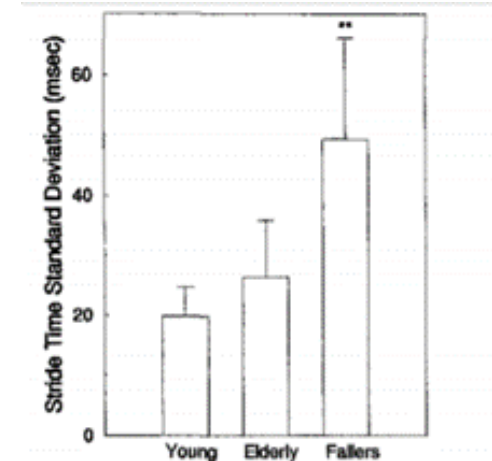

Detection of steps is really important:
Must improve

	Placements	Treadmill operational mode				
		slow	comfortable	high	Asymmetrical	
Mean σ_t [ms]	waist	31	21	16	+*	30
	pocket	29	18	15	+*	31
	hand	30	19	15	+*	30
Mean σ_s^{adj} [ms]	waist	31	22	15	+*†	35
	pocket	31	17	15	+*	33
	hand	28	21	14	†	30
RMSE σ_s^{adj} [ms]	waist	6	3	2		4
	pocket	2	3	5		4
	hand	5	9	10		7

* Significance between low and comfortable speed; † Significance between comfortable and high speed; ‡ Significance between low and high speed; No statistical test was done on asymmetrical gait because of the low number of participants.

(Hausdorff et al., 2001)

(Hausdorff et al., 1997)

Measurements in Elderly and Young

Objective

Calculate **gait variability** and **nonlinear measure**: Lyapunov exponent on elderly and young adults

We developed an android app for hospital physiotherapist to measure phone IMU signals

Enguerren Houdry

6 young
Expect 10 young

6 old non-fallers
Expect 30 elderly with fallers

Walk back and forth

- Estimate Lyapunov exponent
- Estimate Standard deviation of stride time

Findings: Gait variability

P: pass in hallway

Average: 34 ± 13 ms

Average: 29 ± 8 ms

(Hausdorff et al., 1997)

Findings: Lyapunov

What is the Lyapunov exponent?

- Estimates a system's local dynamic stability.
- Reflects the ability to recover from small perturbation
- The higher it is, the worse the system's resistance to local perturbations

Figure 3.
Mean and SD of maximum Lyapunov exponent (maxLE) by group. FO = fall-prone old, HO = healthy old, HY = healthy young.

Lockhart T. E. and Liu J. (2008)

Machine learning and improved hand step detection

8 subjects walking on treadmill 3 different speeds for 210 secs and recording 360 steps per speed per subject.

Total number of steps in database: $3 \times 360 \times 8 = 8640$ examples

Find a way to associate X and Y using a model

Y=1

X=Features

Y= 0 if no-step 1 if step occurred

Histogram based Gradient boosting

Sensitivity: 98%

Specificity: 96%

!

- Only treadmill walking
- No irregular activities
- Sensor placed in hand (wrist placement can be different)
- Only on young adults

Conclusions and Future work

Conclusions

We were able to measure stride time variability with a good precision for different phone handling positions

Created a phone IMU recording app and were able to record 6MWT at Hospital and extract data

Promising results from machine learning for step detection

Future work

Enlarge dataset to include many cases for machine learning model

Different activities

Different walking environments

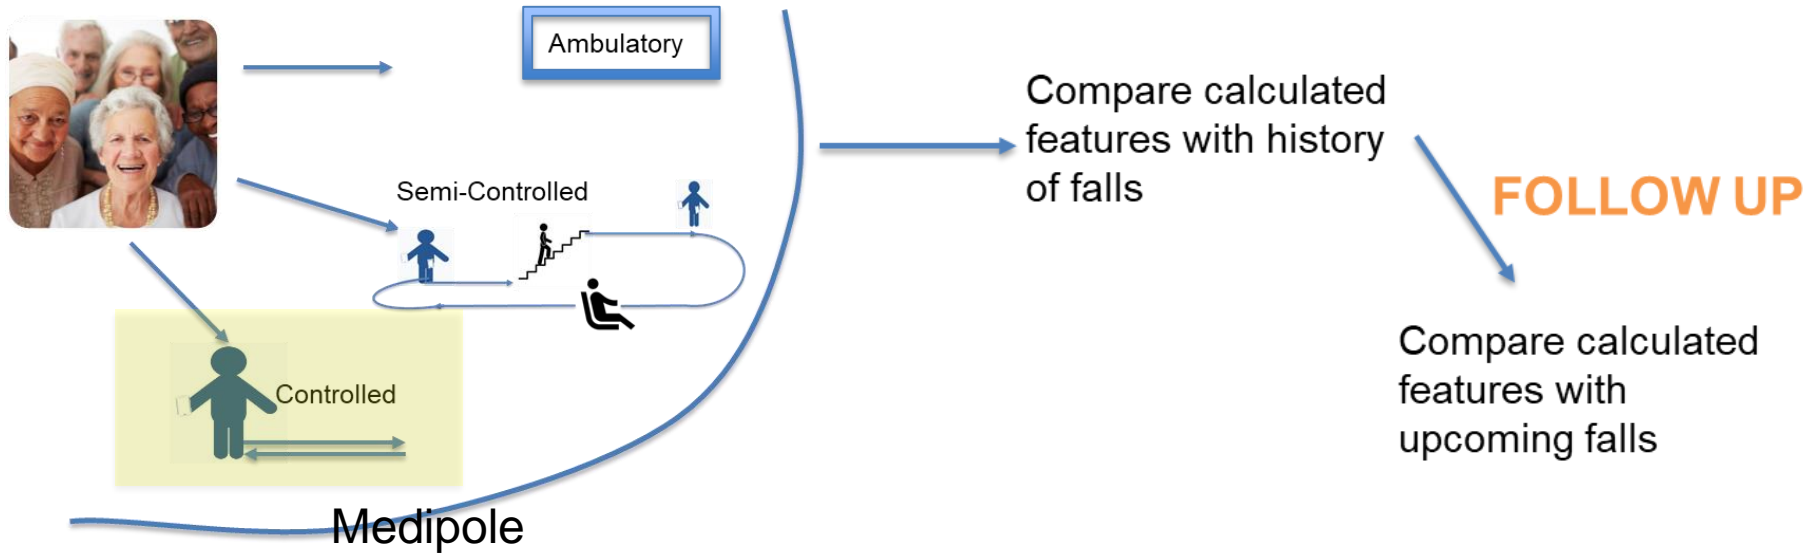

Add population

Use online databases
Medipole experiment data

Future work

Include more elderly population and follow up phases.

We want to get to ambulatory assessments

Thank you for listening
